Stratabound Finds More Gold Showings in Western New Brunswick

- New highly prospective properties staked along Trans-Canada Highway construction

CALGARY, ALBERTA – **Stratabound Minerals Corp. (TSX.V: SB)** is pleased to announce additional gold occurrences have been discovered on the Big Presque Isle property and on recently staked claims at Lamoreaux Corner.

A new showing has been found on Big Presque Isle, some 900 metres north of the breccia-hosted gold mineralization (3.80 g/t across 7 metres) reported on April 9, 2007, and 750 metres north of the mineralized gabbro reported on May 2, 2007 (6.31 g/t in a 1.54 kilogram grab sample). The latest occurrence hosts gold in an altered zone containing 5 to 15% arsenopyrite within a gabbroic dyke characterized by local apple-green alteration. Initial grab samples have returned 1.14 and 1.53 g/t gold.

Roadside prospecting at Lamoreaux Corner to the north of Big Presque Isle has also been encouraging, with grab samples from locations 400 metres apart returning gold assays of 1.16 g/t (siliceous limonitic intrusive) and 0.67 g/t (siliceous intrusive with 1-2% pyrite). These occurrences are located 5.6 and 6.0 kilometres north of the latest Big Presque Isle showing. The Lamoreaux Corner property has consequently been expanded from 10 to 49 claims.

Stratabound would also like to report that six properties have now been staked along the new section of the Trans-Canada Highway, currently under construction alongside the Saint John River Valley in western New Brunswick, near the Maine, U.S. border. The Company is proceeding with an exploration program of prospecting, geological mapping, geochemistry, geophysics and drilling on these claims.

The properties were staked following the initial discovery of gold occurrences on the Company's Big Presque Isle claims. These showings are believed to be the first mineral occurrences ever found in this district, which has never been systematically explored for gold. Stratabound's land holdings in the area now amount to 145 claims, totaling 5,800 acres (2,350 hectares).

The properties are distributed along a 60-kilometre stretch of the new road. From south to north they include St. Thomas (6 claims); Big Presque Isle (72 claims); Lamoreaux Corner (49 claims); Beechwood-Upper Guisiguit (6 claims); Aroostook

(6 claims); and Four Falls (6 claims). Location maps can be viewed on the Company's website, www.stratabound.com.

The five new properties replicate the geological setting of Big Presque Isle. They represent areas where Stratabound anticipates that the road will uncover dyke swarms intruding Ordovician- and Silurian-age argillaceous limestones along a major structural feature that roughly follows the west side of the river valley.

Samples were submitted for analysis to SGS Mineral Services in Toronto, Ontario. Gold was assayed by fire assay with atomic absorption finish. The technical information contained in this release has been reviewed by John Duncan, P.Geo. and Stan Stricker, P.Geo., Qualified Persons as defined in National Instrument 43-101.

About Stratabound

Stratabound is a Canadian junior mining and exploration company currently active in the prolific Bathurst base metal mining district and in several gold-prone areas of New Brunswick, in two mineral-rich regions of northern Quebec, and on a volcanogenic massive sulphide property 130 kilometres north of Lake Superior, Ontario. An initial mineral resource estimate and associated Technical Report compliant with National Instrument 43-101 is currently in preparation for the Company's Elmtree Gold Property located near Bathurst, New Brunswick.
